1. Introduction

In this report, I detail how SYOS (Synex Outlet Store) Point of Sale, originally developed for consoles, was successfully rebuilt as a multi-user, multi-tier, web application. Using still the Clean Architecture, the system now acts as a full e-commerce platform that supports many users at the same time through advanced parallel processing. The new software is impressive because it showcases excellence in GUI design, handling concurrent work on the server, handling asynchronous functions on the client, designing a distributed system and validating extensive load testing.

2. GUI Development

2.1. Complete Use Case Implementation

Admin, Cashier and Online Customer each have their own dashboard through the interface, based on what they do. All the product management, category management, stock management, shelves management, order management, customer management, supplier management, billing and reporting functions can be used with ease through web forms and interactive displays.

The GUI holds onto the original system's full functionality but adds additional features for the web, including thorough form validation and responsive design. Users are able to carry out all actions such as product creation, view, updating and deletion, handling orders, processing sales, controlling inventory, managing shelves and categories, dealing with users, creating reports, billing, customers managing and managing suppliers.

2.1.1. Admin Dashboard

- Admin - can manage Products, Orders, Stocks, Shelves, Categories, Users, Reports, Customers, Suppliers
- View - /admin/dashboard

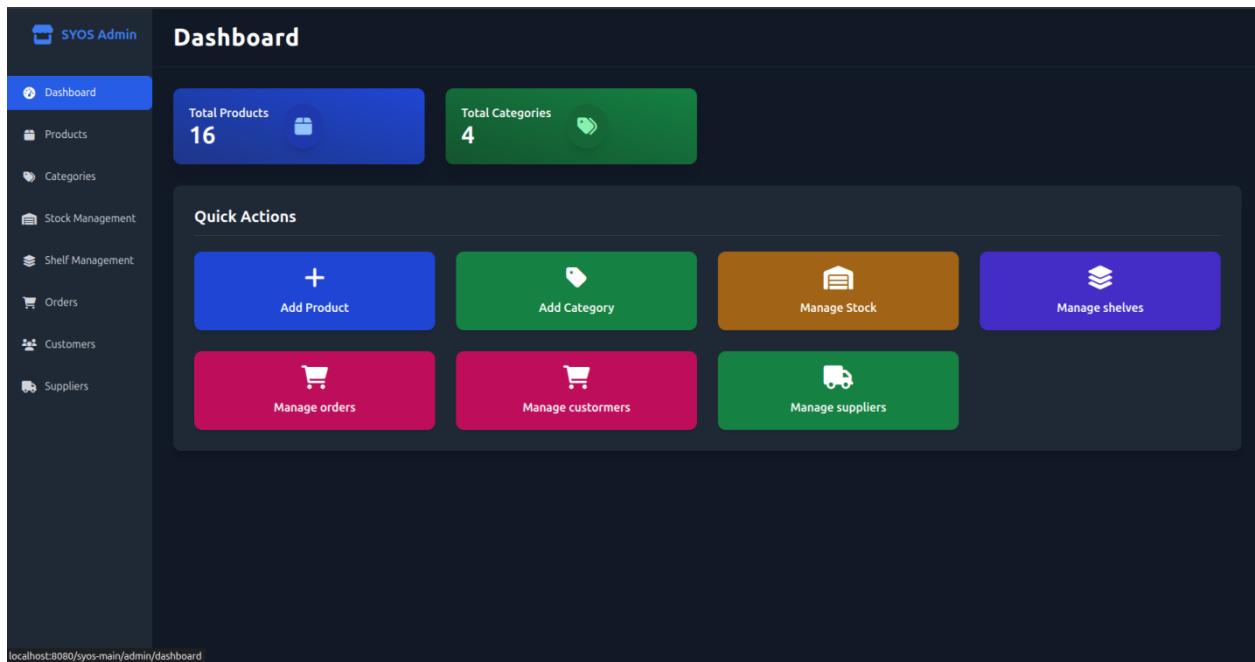

Figure 1 : Admin Dashboard

- Manage Products – Admin can add new Products ,Edit Existing products, Delete Products, View Products
- View - /admin/products

The screenshot shows the SYOS Admin interface for Product Management. On the left is a sidebar with navigation links: Dashboard, Products (selected), Categories, Stock Management, Shelf Management, Orders, Customers, and Suppliers. The main area is titled "Products Management" and contains a table with the following data:

PRODUCT	CATEGORY	PRICE	STATUS	STOCK ALERT	ACTIONS
Sugar Latest model with advanced features	Food & Beverages	\$999.99	Active	5	
Noodles High-performance laptop for professionals	Food & Beverages	\$1499.99	Active	3	
Cooking oil Noise-cancelling wireless headphones	Food & Beverages	\$249.99	active	8	
Bread Fitness tracking smartwatch	Food & Beverages	\$199.99	active	10	
Ambewela Milk Comfortable cotton t-shirt	Perishables	\$19.99	active	10	
Eggs Durable everyday jeans	Perishables	\$49.99	active	8	
Yogurt Warm winter jacket with hood	Perishables	\$89.99	active	5	
Cheese Comfortable athletic shoes for running	Perishables	\$69.99	active	7	
Chocolates Automatic drip coffee maker	Snacks & Confectionery	\$79.99	active	5	
Chips Complete set of non-stick cookware	Snacks & Confectionery	\$129.99	active	3	

localhost:8080/syos-main/admin/products

Figure 2 : Products Management

The screenshot shows the SYOS Admin interface for Product Management. A modal dialog box titled "Add New Product" is open over the product list. The dialog contains fields for Product Name, Category (Personal Care), Supplier (TechSupplier Inc.), Price, Status (Active), Unit ID, Warehouse ID, Stock Alert Level, and Description/Notes. At the bottom right of the dialog are "Cancel" and "Add Product" buttons.

Figure 3 : Add New Product (Admin)

- Manage Categories— Admin can add new Category, Edit Existing Category, Delete Category, View Category

- View - /admin/categories

The screenshot shows the 'Categories Management' page from the SYOS Admin interface. On the left is a sidebar with navigation links: Dashboard, Products, Categories (which is selected), Stock Management, Shelf Management, Orders, Customers, and Suppliers. The main area has a title 'Categories Management' and a '+ Add Category' button. Below are four cards representing existing categories:

- Personal Care**: Soap, Shampoo, Toothpaste... (ID: 4, Created: 2025-05-21 18:25:49.0)
- Food & Beverages**: Rice, Sugar, Salt... (ID: 1, Created: 2025-05-21 18:25:49.0)
- Perishables**: Milk, Eggs, Butter... (ID: 2, Created: 2025-05-21 18:25:49.0)
- Snacks & Confectionery**: Chips, Chocolates, Candies... (ID: 3, Created: 2025-05-21 18:25:49.0)

A dashed box highlights a central area with a plus sign and the text 'Add New Category'.

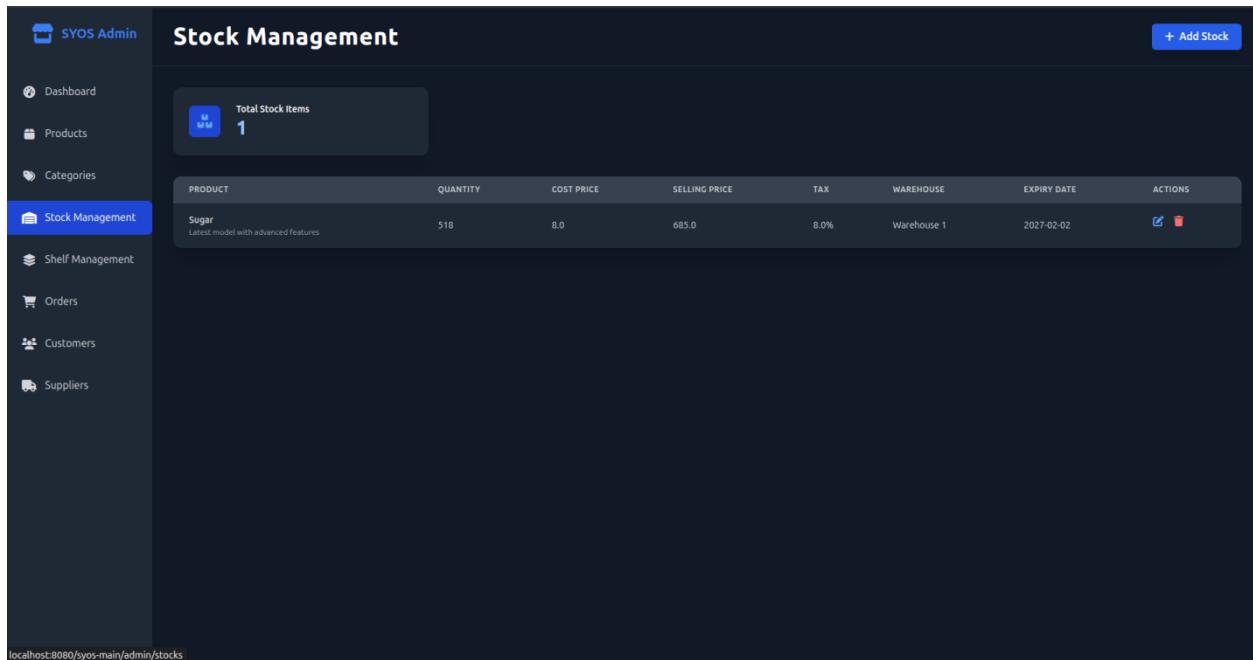

localhost:8080/syos-main/admin/categories

Figure 4 : Categories Management

The screenshot shows the 'Categories Management' page with a modal window titled 'Add New Category'. The modal contains fields for 'Category Name' and 'Description', both currently empty. At the bottom are 'Cancel' and 'Add Category' buttons. The background shows the same list of categories as Figure 4.

Figure 5 : Add New Category (Admin)

- Manage Stocks— Admin can add new Stocks, Edit Existing Stocks, Delete Stocks, View Stocks
- View - /admin/stocks

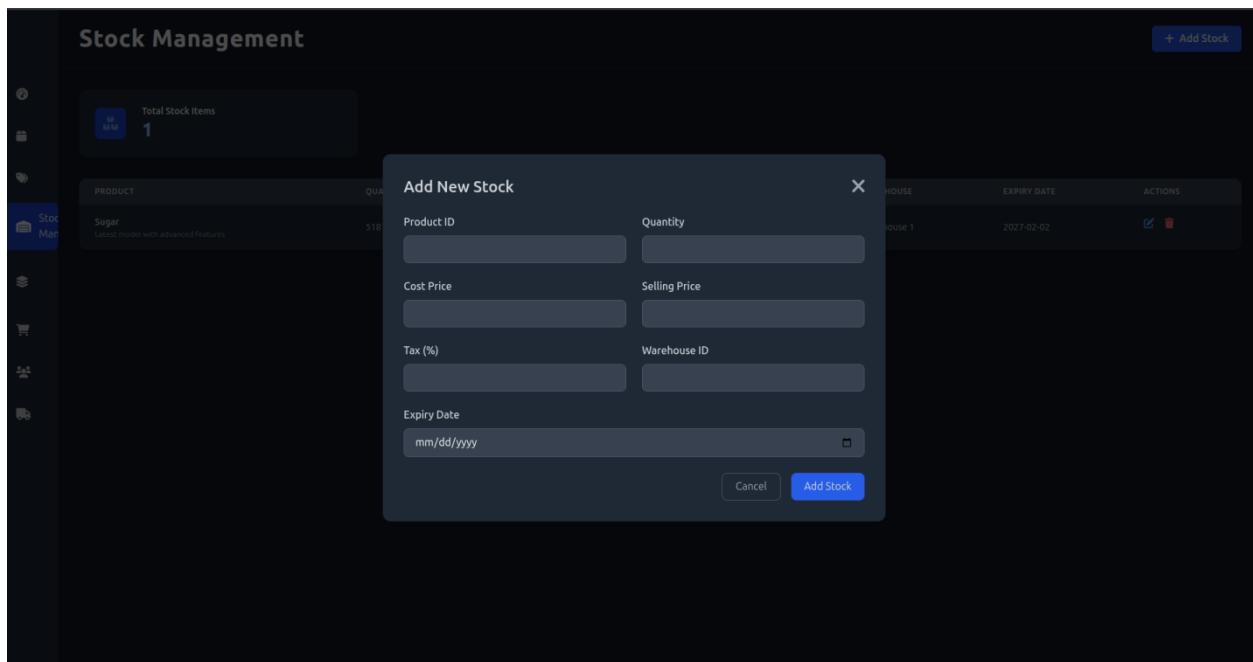

The screenshot shows the Stock Management section of the SYOS Admin interface. On the left is a sidebar with various navigation options. The main area displays a table of stock items. A modal at the top right allows adding new stock.

Total Stock Items: 1

PRODUCT	QUANTITY	COST PRICE	SELLING PRICE	TAX	WAREHOUSE	EXPIRY DATE	ACTIONS
Sugar Latest model with advanced features	518	8.0	685.0	8.0%	Warehouse 1	2027-02-02	

Figure 6 : Stock Management

The screenshot shows the 'Add New Stock' modal overlaid on the Stock Management page. The modal contains fields for Product ID, Quantity, Cost Price, Selling Price, Tax (%), Warehouse ID, and Expiry Date. It includes a 'Cancel' button and an 'Add Stock' button.

Figure 7 : Add New Stock

- Manage Shelf– Admin can add new Shelf, Edit Existing Shelf, Delete Shelf, View Shelf
- View - /admin/shelves

The screenshot shows the 'Shelf Management' page from the SYOS Admin interface. On the left is a dark sidebar with various navigation options: Dashboard, Products, Categories, Stock Management, Shelf Management (which is selected and highlighted in blue), Orders, Customers, and Suppliers. The main content area has a title 'Shelf Management' at the top right with a '+ Add to Shelf' button. Below it is a summary box titled 'Items on Shelf' showing '1'. A table lists one item: Shelf ID #1, Product ID 1, Stock ID 1, Quantity 45 (Medium), Added Date 2025-05-23 19:36:06.0, Status Available, and Actions (Edit, Delete). At the bottom left of the main area, the URL 'localhost:8080/syos-main/admin/shelves' is visible.

Figure 8 : Shelf Management

The screenshot shows the 'Shelf Management' page with a modal dialog titled 'Add to Shelf' overlaid. The modal contains fields for 'Stock ID' (with placeholder 'Enter stock ID'), 'Product ID' (with placeholder 'Enter product ID'), and 'Quantity' (with placeholder 'Enter quantity'). At the bottom of the modal are 'Cancel' and 'Add to Shelf' buttons. The background of the main page shows the same shelf management table as Figure 8, with one item listed.

Figure 9 : Add to shelf (Admin)

- Manage Orders— Admin can View orders, and also can change order status.
- View - /admin/orders

The screenshot shows the SYOS Admin Orders Management interface. On the left is a sidebar with navigation links: Dashboard, Products, Categories, Stock Management, Shelf Management, Orders (which is selected and highlighted in blue), Customers, and Suppliers. The main area has a title 'Orders Management' and displays two summary boxes: 'Total Orders' (2) and 'Total Amount' (Rs. 495.16). Below this is a table titled 'Orders List' with columns: ORDER ID, CUSTOMER, ITEMS, TOTAL AMOUNT, STATUS, DATE, and ACTIONS. Two orders are listed:

ORDER ID	CUSTOMER	ITEMS	TOTAL AMOUNT	STATUS	DATE	ACTIONS
#ORD-BC196754	User ID: 15	1 items	Rs.53.18	Pending	2025-05-24 15:38:54.0	
#ORD-ADAC2BCB	User ID: 14	1 items	Rs.441.98	Pending	2025-05-23 18:27:24.0	

localhost:8080/syos-main/admin/orders

Figure 10 : Order Management

- Manage Customers– Admin can add new Customer, Edit Existing Customer, Delete Customer, View Customer
- View - /admin/customers

The screenshot shows the SYOS Admin interface with a dark theme. On the left is a sidebar with icons for Dashboard, Products, Categories, Stock Management, Shelf Management, Orders, Customers (which is selected and highlighted in blue), and Suppliers. The main title is "Customers Management". A summary box displays "Total Customers 1". Below it is a table titled "Customers List" with one row. The columns are CUSTOMER, EMAIL, PHONE, and JOIN DATE. The data row shows a user icon, "Regina Keller ID: 1", "vufa@mailinator.com", "+1 (442) 724-8588", and "2025-05-23 18:27:45.0". There is an "Actions" column with edit and delete icons. A blue button at the top right says "+ Add Customer". At the bottom left, the URL "localhost:8080/syos-main/admin/customers" is visible.

Figure 11 : Customers Management

This screenshot shows the same SYOS Admin interface as Figure 11, but with an "Add New Customer" dialog box overlaid. The dialog has fields for "Customer Name", "Email", and "Phone". At the bottom are "Cancel" and "Add Customer" buttons. The background shows the same customer list as Figure 11, with the "Customers" menu item still highlighted in blue.

Figure 12 : add New Customer

- Manage Suppliers – Admin can add new Suppliers, Edit Existing Suppliers, Delete Suppliers, View Suppliers
- View - /admin/suppliers

The screenshot shows the SYOS Admin Suppliers Management page. On the left is a sidebar with navigation links: Dashboard, Products, Categories, Stock Management, Shelf Management, Orders, Customers, and Suppliers (which is currently selected). The main area has a title "Suppliers Management" and a sub-section "Total Suppliers" showing a count of 5. Below this is a table listing five suppliers:

Supplier Name	Contact Information	Status
TechSupplier Inc.	john@techsupplier.com, 123-456-7890, 123 Tech St, Silicon Valley, CA	Active
Fashion Fabrics Ltd.	emma@fashionfabrics.com, 234-567-8901, 456 Fashion Ave, New York, NY	Active
Home Essentials Co.	mike@homeessentials.com, 345-678-9012, 789 Home Blvd, Chicago, IL	Active
Book Publishers Ltd.	sarah@bookpublishers.com, 456-789-0123, 101 Book Lane, Boston, MA	Active
Mollie Daniels	waveyurin@mailinator.com, +1 (945) 891-8444, Et veniam est quia	Active

A modal window titled "Supplier Details" is open over the table, showing placeholder information for a supplier with ID 1. The modal includes fields for Supplier Information, Total Orders (4), Total Amount (\$12,450), Last Order (2024-01-15), and Status (Active). A "Close" button is at the bottom right of the modal.

At the bottom left of the page, the URL "localhost:8080/syos-main/admin/suppliers" is visible.

Figure 13 : Suppliers Management

This screenshot shows the same Suppliers Management page as the previous one, but with a different view. The sidebar now includes a "Sup" link under the Suppliers category. The main table is identical to the first screenshot. However, the modal window is now larger and displays more detailed information for the supplier with ID 1, "TechSupplier Inc.". The modal is titled "Supplier Details" and contains a "Supplier Information" section with a note: "Detailed supplier information would be loaded here for supplier ID: 1". It also shows summary statistics: Total Orders: 4, Total Amount: \$12,450, Last Order: 2024-01-15, and Status: Active. A "Close" button is at the bottom right of the modal.

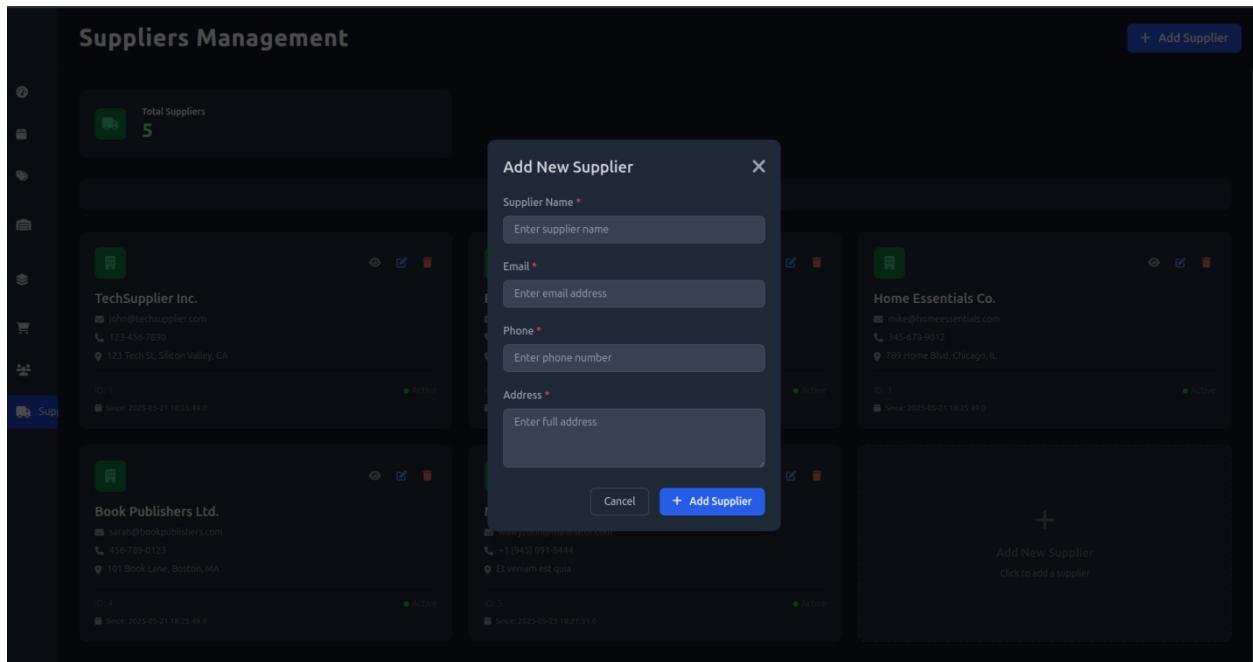

Figure 14 : Add new supplier

2.1.2. Cashier Dashboard

- This is Cashier dashboard. Cashier can Generate bills , can view all bills , and also can print bills .

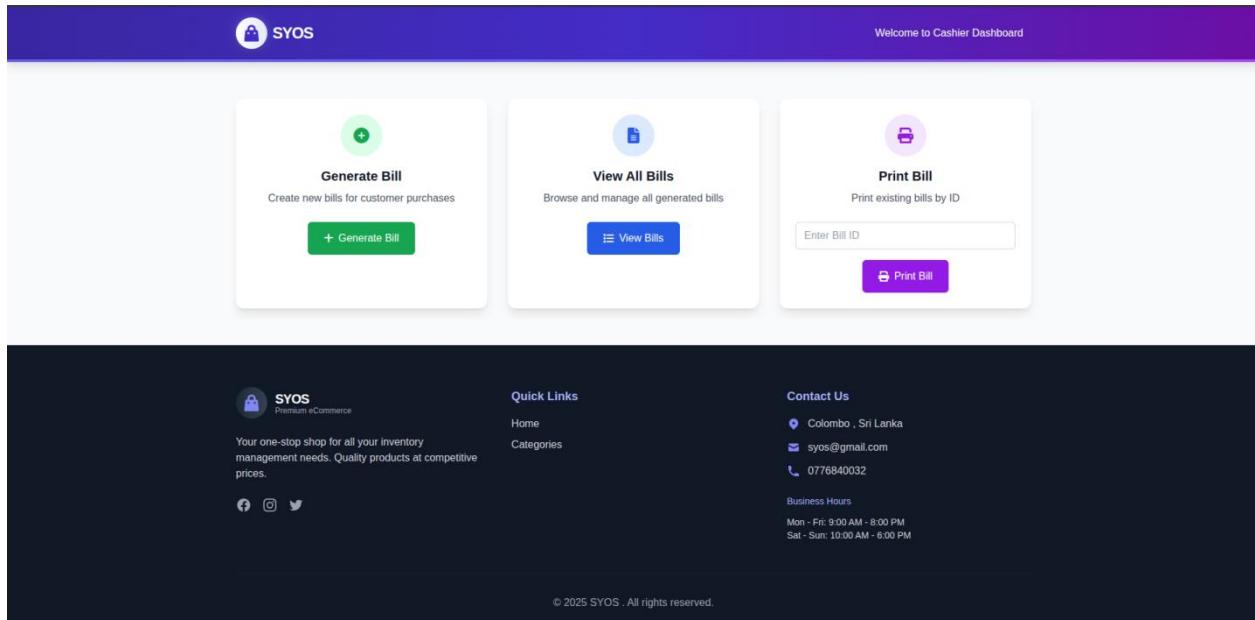

Figure 15 : Cashier Dashboard

- Customer Management
 - Customer ID field (optional) for tracking repeat customers
 - Option to leave blank for walk-in customers
- Product Management
 - Product selection dropdown menu
 - Quantity input field
 - Price per unit display
 - Total calculation per line item
 - "Add Product" button to include multiple items
 - Delete option (trash icon) to remove items
- Pricing & Calculations
 - Subtotal - Base amount before adjustments
 - Discount System
 - Discount type selector (Fixed , Percentage)
 - Discount value input field

- Tax Management
 - Tax type dropdown (Fixed , Percentage)
 - Tax value input field
- Final Total - Automatically calculated final amount
- Payment Processing
 - Received Amount field for cash transactions
 - Change Return calculation (automatically computed)
 - Payment Status dropdown (currently set to "Paid")
- Transaction Management
 - Cancel option to abort the transaction
 - "Save Bill" to record the transaction
 - "Save & Print" to generate receipt

The screenshot displays the SYOS Cashier Dashboard interface. At the top, there is a purple header bar with the SYOS logo and the text "Welcome to Cashier Dashboard". Below the header, the main content area is titled "Bill Information".

Customer Information:

- Customer ID (Optional): A text input field containing the placeholder "Leave blank for walk-in".

Products:

Product	Quantity	Price (Rs.)	Total (Rs.)
Select Product		0.00	0.00

Discount Type: No Discount

Discount Value: 0

Tax Type: No Tax

Tax Value: 0

Subtotal: Rs. 0.00

Discount: Rs. 0.00

Tax: Rs. 0.00

Total: Rs. 0.00

Received Amount (Rs.): (empty input field)

Change Return: Rs. 0.00

Payment Status: Paid

Buttons:

- X Cancel
- Save Bill (purple button)
- Save & Print (green button)

2.2. Standard Web Features Integration

It includes all features found in web development today such as responsive CSS, JavaScript form validation, AJAX-based asynchronous communication, session management and secure authentication, with tailwindCSS for user interface design. The way it looks changes automatically based on the device you use, so it's useful on desktop computers, tablets and mobile phones.

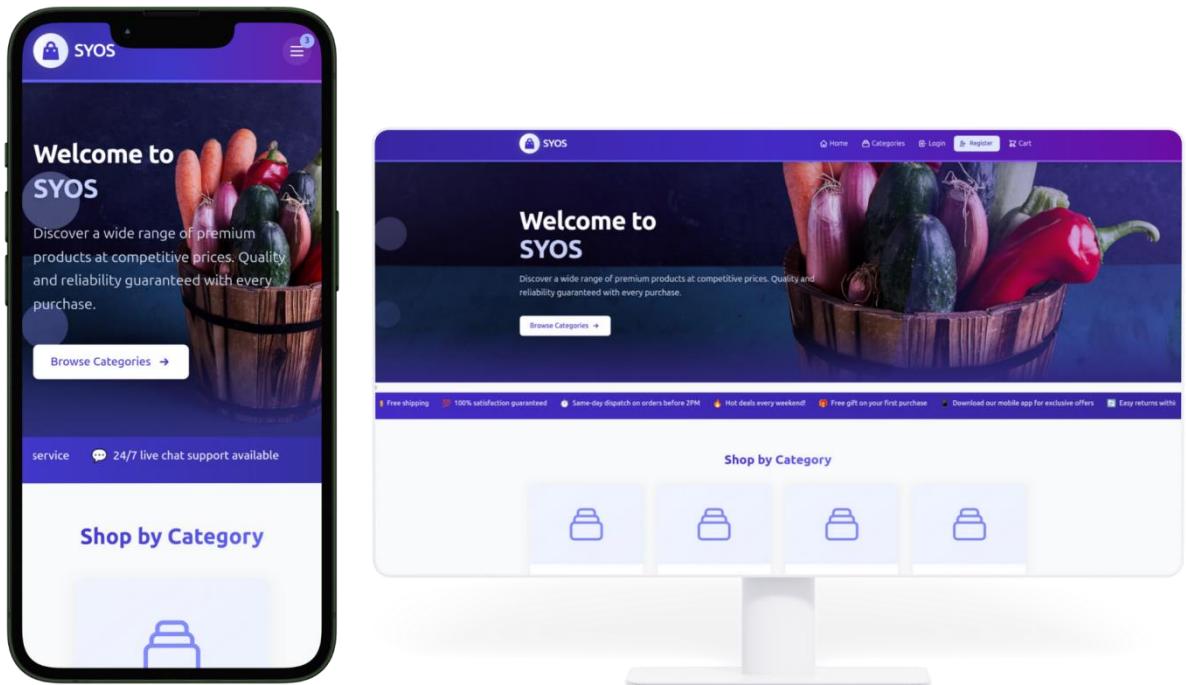

Figure 19 : Home page

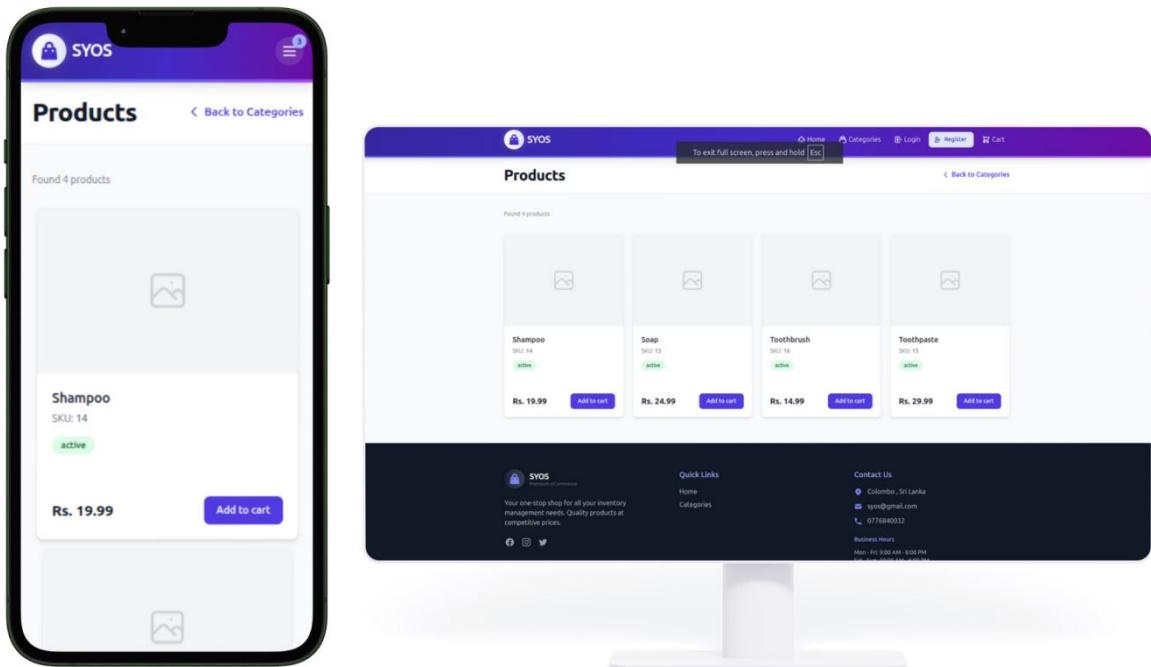

Figure 20 : Product List page

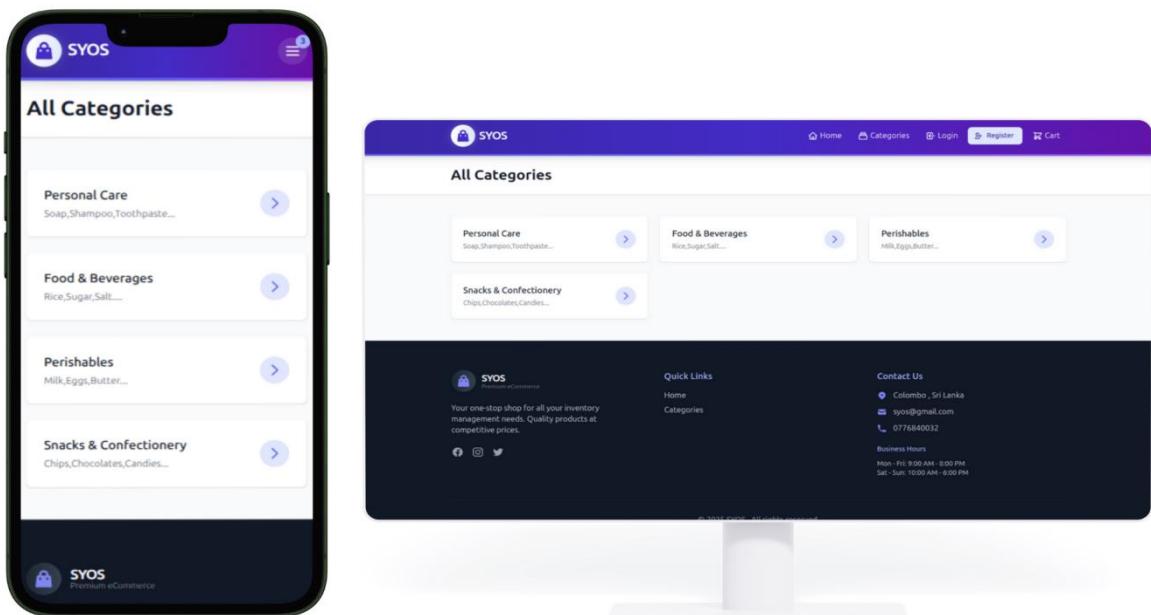

Figure 21 : Categories List Page

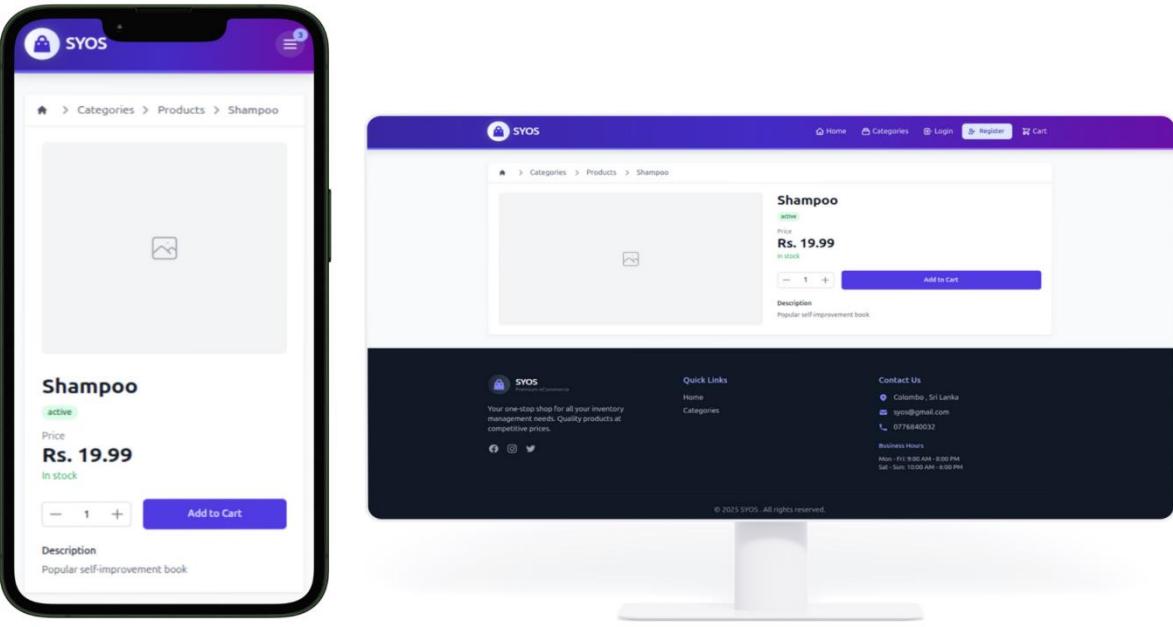

Figure 22 : Product View

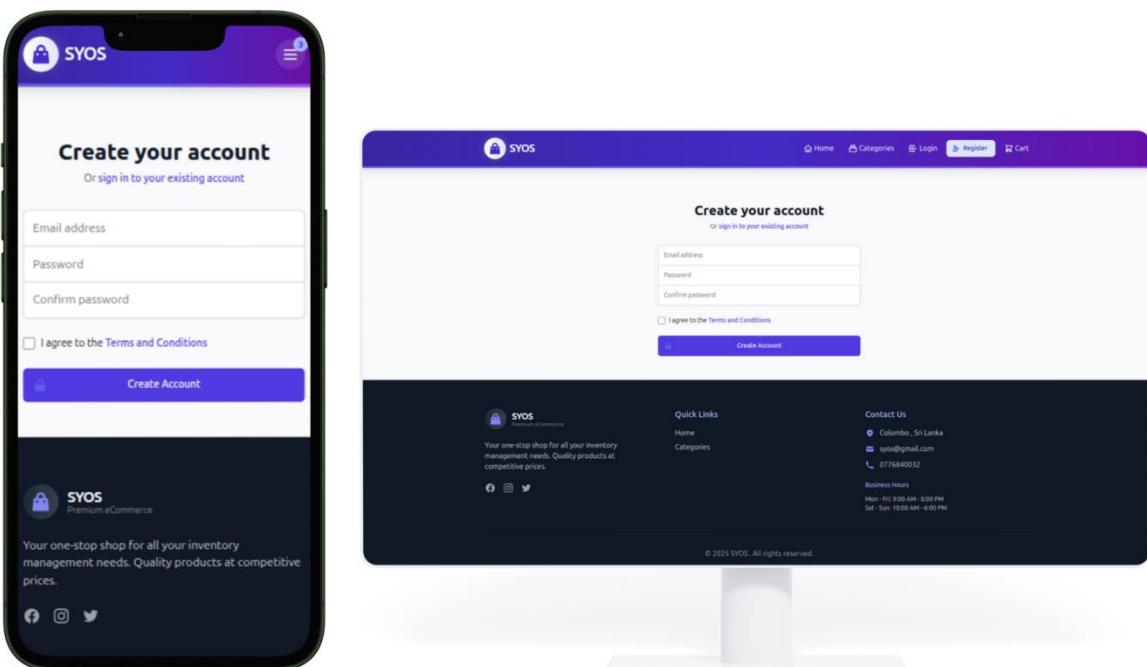

Figure 23 : Register Page

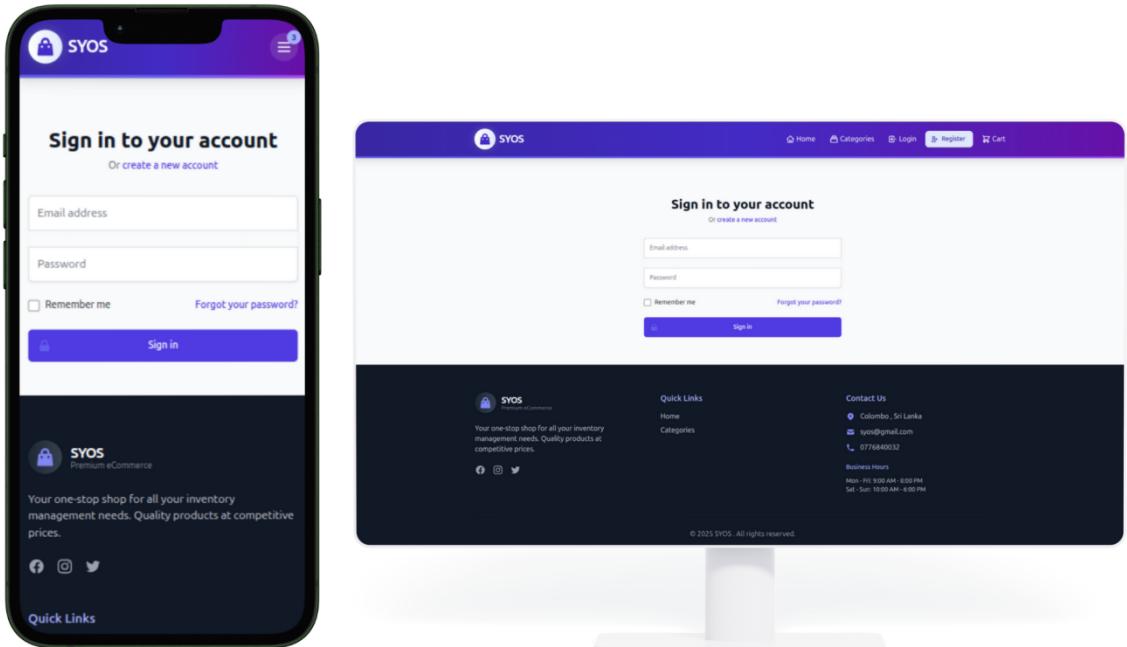

Figure 24 : Login Page

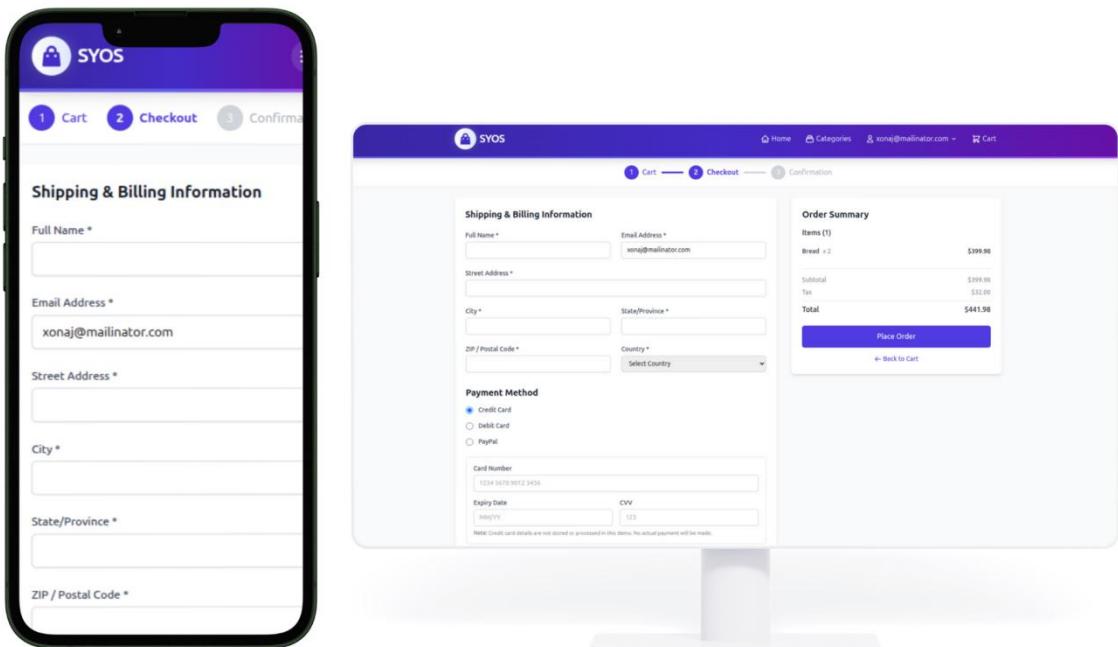

Figure 25 : Checkout Page

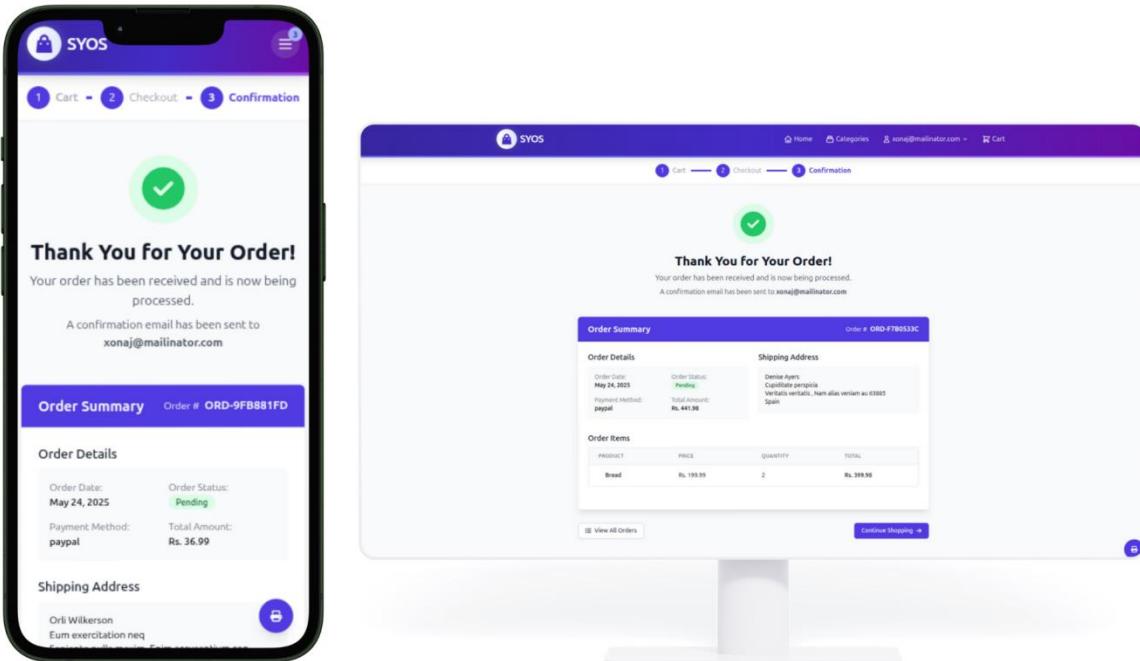

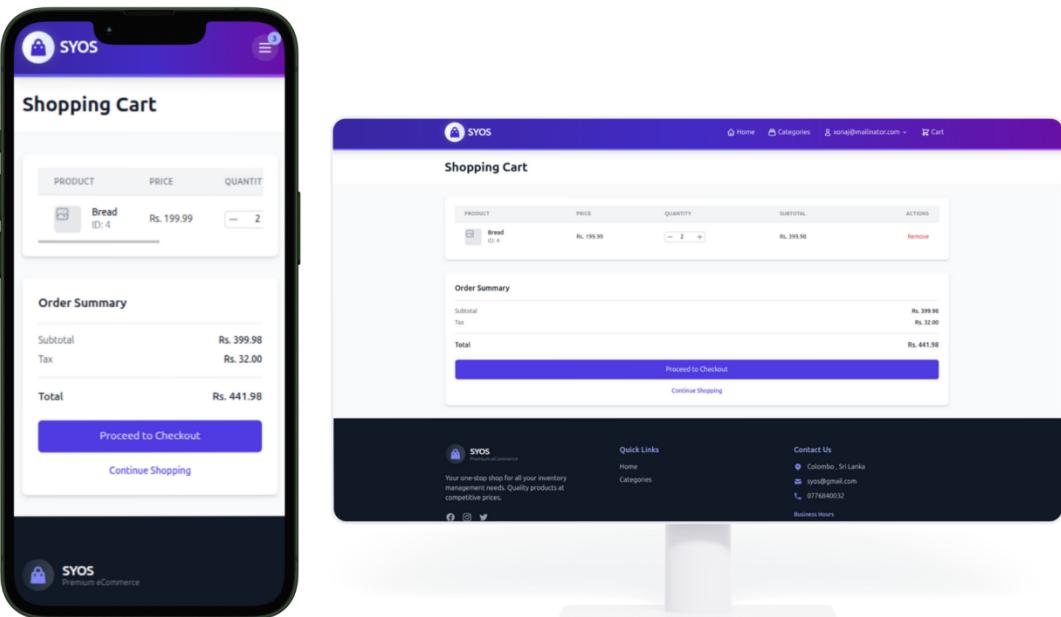

Figure 26 : Thank You Page

Figure 27 : Cart Page

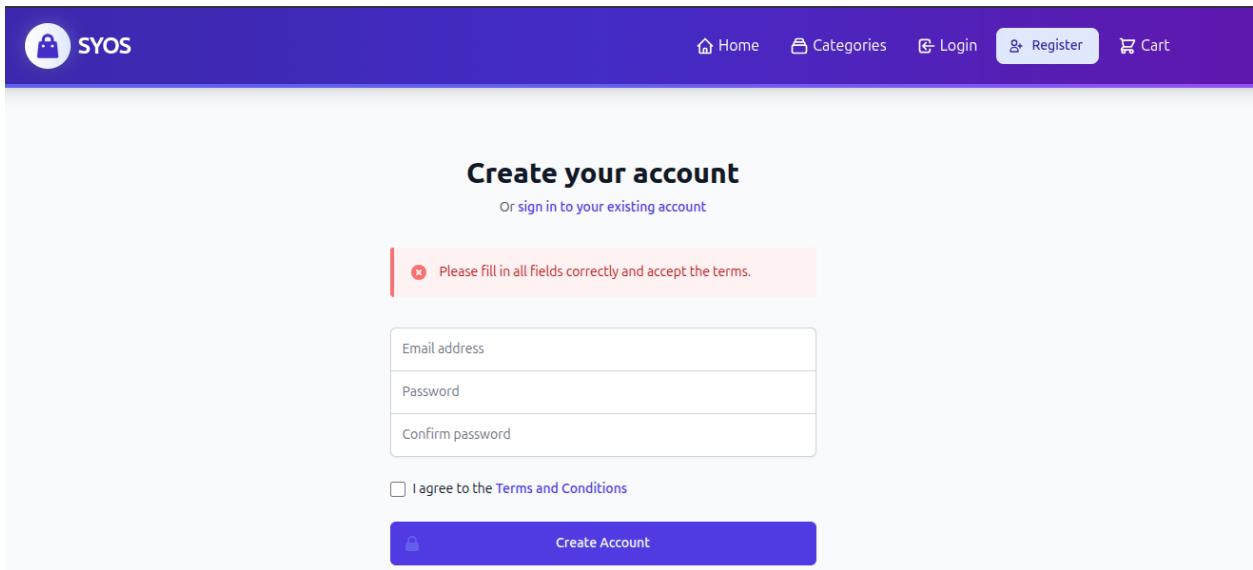

2.3 Enhanced User Experience Features

The user interface is built with advanced UX patterns to improve how easy it is to use and access the system. The main characteristics are that

- Real-Time Feedback - Forms provide instant validation using visual indicators (green/red), enabling users to correct input errors immediately.
- Contextual Help Systems - Integrated assistance tools offer users guidance based on their current interactions.
- Smart Admin Dashboard - Interactive metric cards display real-time business metrics, enabling quick and informed decision-making.
- Sophisticated Notification System - Real-time alerts notify users of critical events

The screenshot shows a login page for a website named 'SYOS'. The top navigation bar includes links for Home, Categories, Login, Register, and Cart. The main content area features a heading 'Sign in to your account' and a sub-instruction 'Or [create a new account](#)'. Below the heading is a red error message box containing the text 'Invalid username or password'. There are two input fields: 'Email address' and 'Password'. Underneath the password field is a 'Remember me' checkbox and a link 'Forgot your password?'. At the bottom is a blue 'Sign in' button with a lock icon.

Figure 28 : Validation

The screenshot shows the SYOS website's account creation page. At the top, there is a purple header bar with the SYOS logo on the left and navigation links for Home, Categories, Login, Register, and Cart on the right. Below the header, the main content area has a white background. The title "Create your account" is centered at the top of the form. Below it, a sub-instruction says "Or sign in to your existing account". A red-bordered error message box contains the text "Please fill in all fields correctly and accept the terms." Below the message box is a form with three input fields: "Email address", "Password", and "Confirm password". Underneath the form is a checkbox labeled "I agree to the Terms and Conditions". At the bottom of the form is a blue button with a lock icon and the text "Create Account".

Figure 29 : Real-time alerts Notification

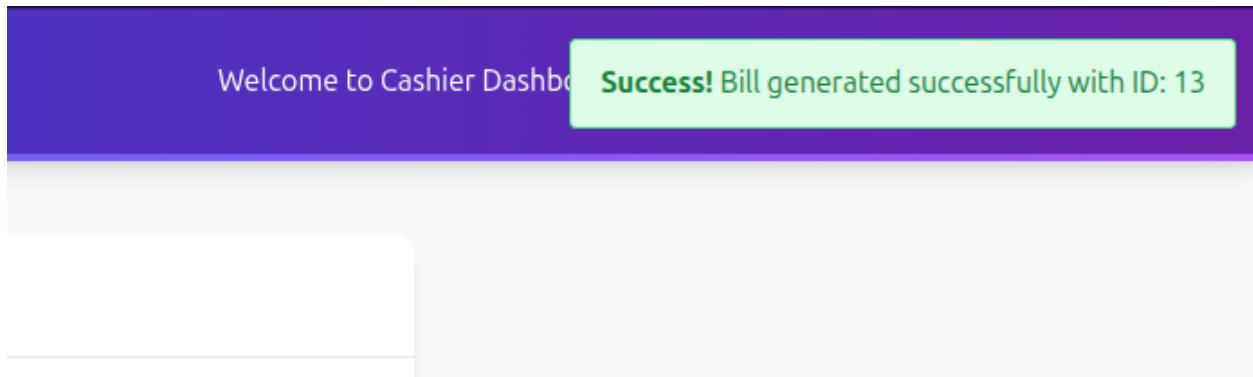

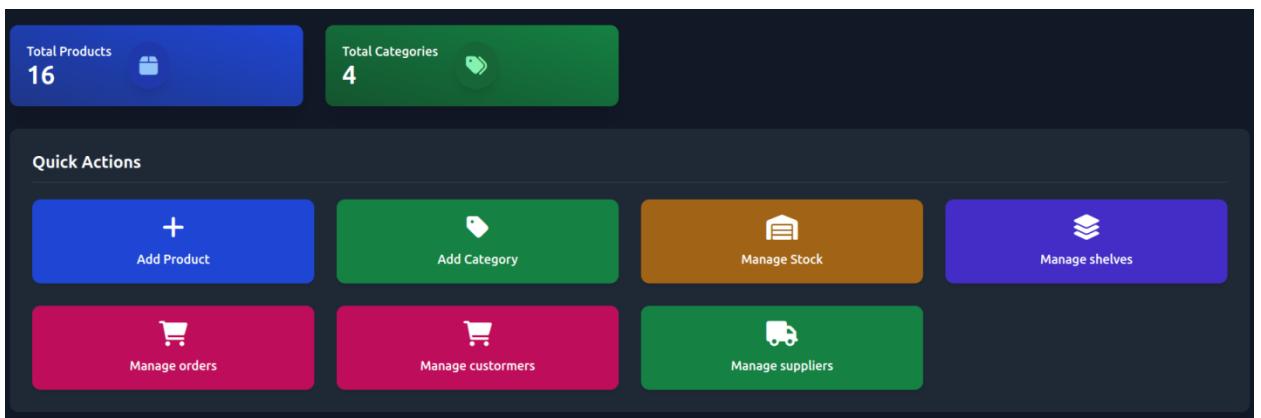

Figure 30 : Interactive metric cards display

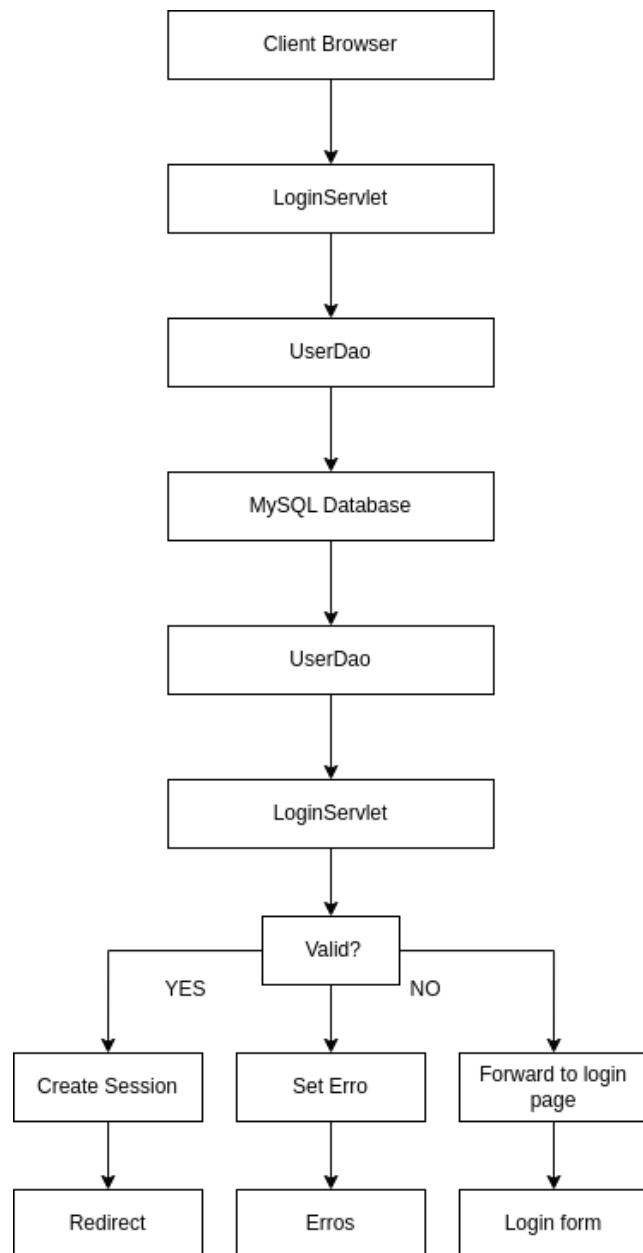

3. Server-side Concurrency Architecture

3.1 Single Client Request Handling

The controller, service and data layers exist within the Clean Architecture in the system to guarantee thread safety. It covers error handling, input validation and reliable methods for displaying responses. The database is reached using prepared statements and connection pooling so SQL injection is prevented and the application performs better.

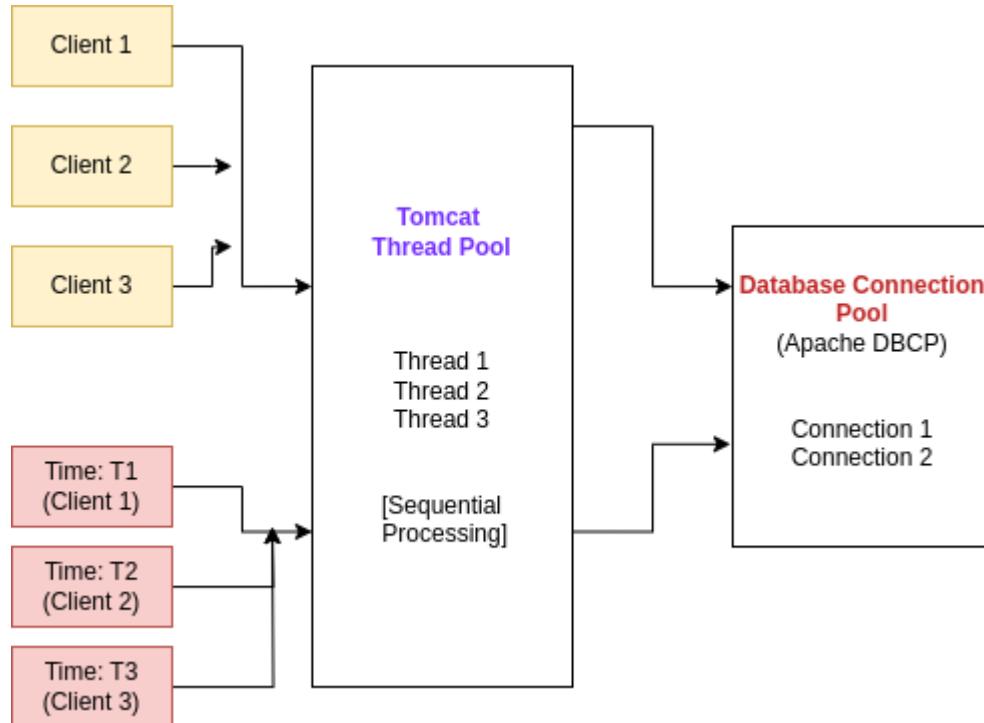

Figure 31 : Login Servlet request processing flow diagram

3.2 Multiple Client Sequential Processing

Clients are served in sequence by Tomcat's thread pool and each client keeps their session independent, using separate memory and authentication. It separates systems, so there are no conflicts, handles resources effectively and uses connection pooling with Apache DBCP for more efficient use of the database.

Figure 32 : Multiple client sequential processing architecture

3.3 Simultaneous Multi-Client Support

- Simultaneously accept multiple client requests by using thread and connection pooling
- Uses Apache DBCP for dedicated database connections per request
- Configured with maxThreads 200, acceptCount 100 (change server.xml in tomcat)
- Connection pool sizes - maxIdle 10,maxTotal 20, minIdle 5
- Supports high concurrent load with reliable response times

```

GNU nano 7.2                               server.xml
    HTTP Connector: /docs/config/http.html
    AJP  Connector: /docs/config/ajp.html
    Define a non-SSL/TLS HTTP/1.1 Connector on port 8080
-->
<Connector port="8080" protocol="HTTP/1.1"
            connectionTimeout="20000"
            maxThreads="200"
            minSpareThreads="25"
            acceptCount="100"
            redirectPort="8443" />
<!-- A "Connector" using the shared thread pool-->
<!--
<Connector executor="tomcatThreadPool"
            port="8080" protocol="HTTP/1.1"

```

Figure 33 : server.xml

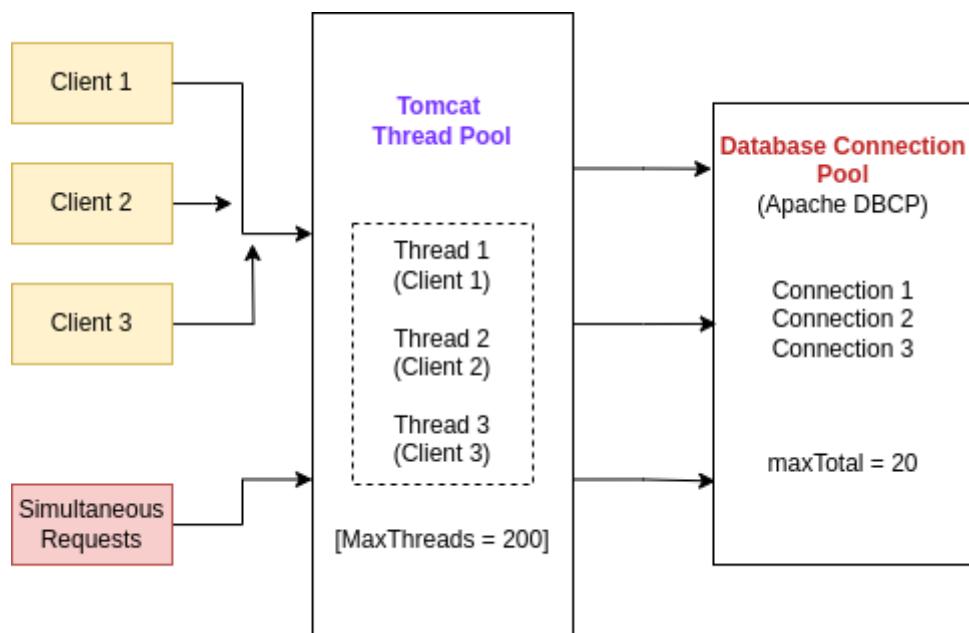

Figure 34 : Concurrent multi-client processing with thread pool management

3.4 High-Volume Request Queuing System

- Tomcat's request queuing and connection pool overflow management
- maxWaitMillis (30000) limits database wait time
- Queues requests when threads are maxed out
- acceptCount (100) buffers requests during peaks
- Prevents system failure and maintains response times during spikes

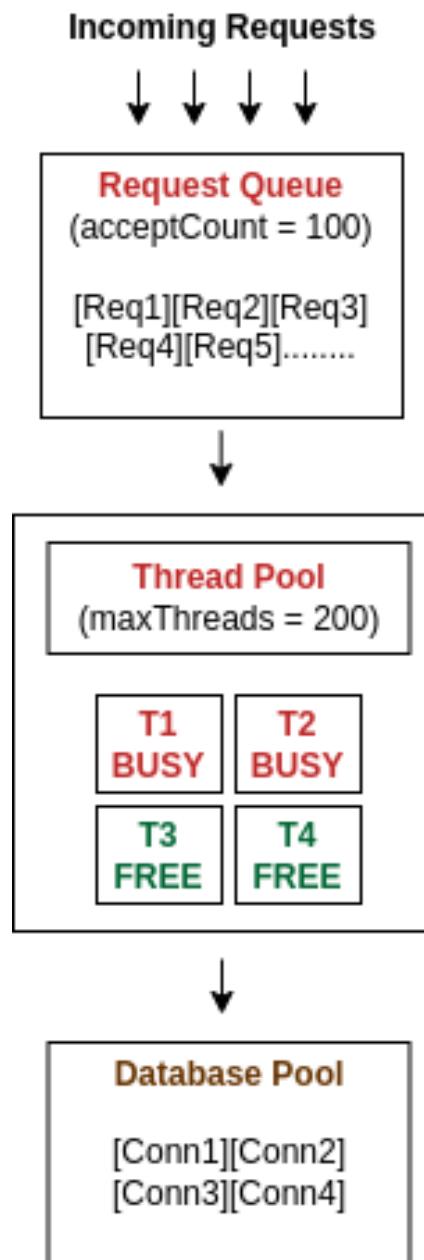

Figure 35 : Request queuing system with overflow protection

```
package db;

import org.apache.commons.dbcp2.BasicDataSource;

import javax.sql.DataSource;
import java.sql.Connection;
import java.sql.SQLException;

public enum DBConnection { @iresha *
    INSTANCE;

    private final BasicDataSource dataSource; 13 usages

    DBConnection() { 2 usages @iresha *
        dataSource = new BasicDataSource();
        dataSource.setUrl("jdbc:mysql://localhost:3306/syos_ecommerce");
        dataSource.setUsername("root");
        dataSource.setPassword("");

        dataSource.setInitialSize(5);
        dataSource.setMaxTotal(20); // Max active connections in the pool
        dataSource.setMaxIdle(10); // Max idle connections
        dataSource.setMinIdle(5); // Min idle connections
        dataSource.setMaxWaitMillis(30000); // Max wait time for a connection
        dataSource.setTestOnBorrow(true); // Test connection before borrowing from pool
        dataSource.setValidationQuery("SELECT 1"); // Validation query to ensure connection is alive
    }

    >     public DataSource getDataSource() { return dataSource; }

    public Connection getConnection() throws SQLException { @iresha
        return dataSource.getConnection(); // Get a connection from the pool
    }
}
```

Figure 36 : implementation of DBCP

4. Client-side Concurrency Implementation

4.1 Basic Client-Server Communication

The client-side architecture handles communication by using the fetch API, Error handling with Promises and automatically trying again for transient problems. Server communications do not restrict user interaction with the app, so users can respond instantly during network activities.

The process also manages different errors by reducing entirely working parts rather than causing the app to crash. User feedback systems offer a clear way to follow long running operations without disrupting how the interface is used.

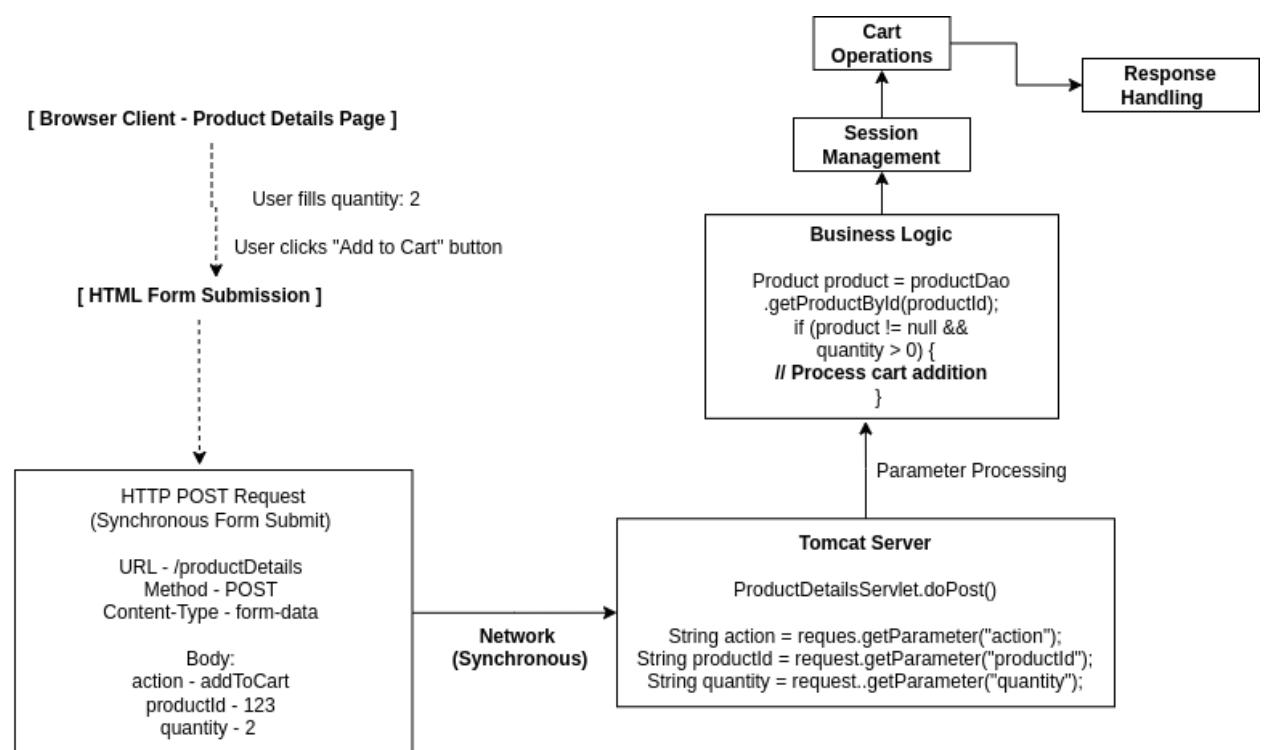

Figure 37 : Client-Server Synchronous Communication (Add to Cart Form Submission)

4.2 Multi-Computer Client Interaction

Multiple clients on different systems can use the server's services without their actions interfering with one another. During operations, the system creates separate session space for each voice call. At the same time, it allows people to collaborate in real time when the situation demands.

As a result of session management, user logins, cart contents and orders work the same both within different browser sessions and even after network interruptions. Implementation stops session hijacking and supports secure operation by multiple clients in common environments.

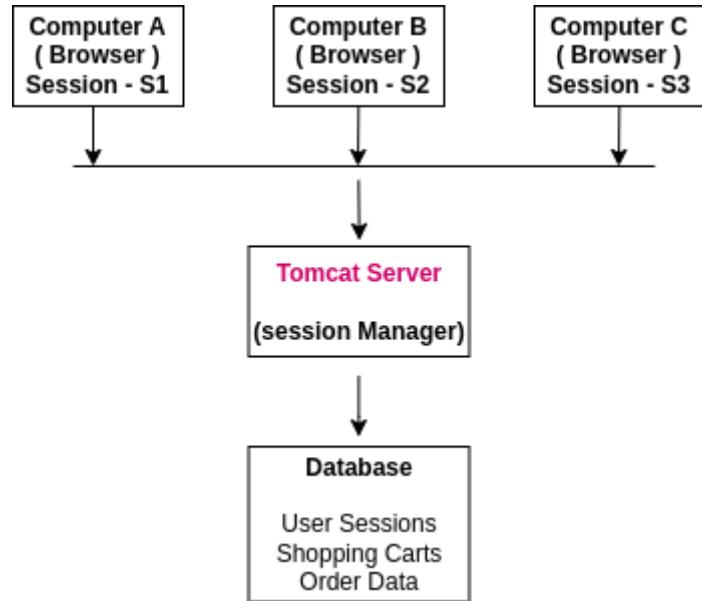

Figure 38 : Multi-computer client coordination and session management

4.3 Real-time Data Synchronization

While the current implementation focuses on individual user sessions and the architecture supports real-time synchronization capabilities for inventory updates and order processing. Product availability changes and pricing updates propagate to client interfaces through efficient polling mechanisms that minimize server load.

The system implements intelligent caching strategies that balance data freshness with performance requirements, ensuring that users always see current information while minimizing unnecessary server requests.

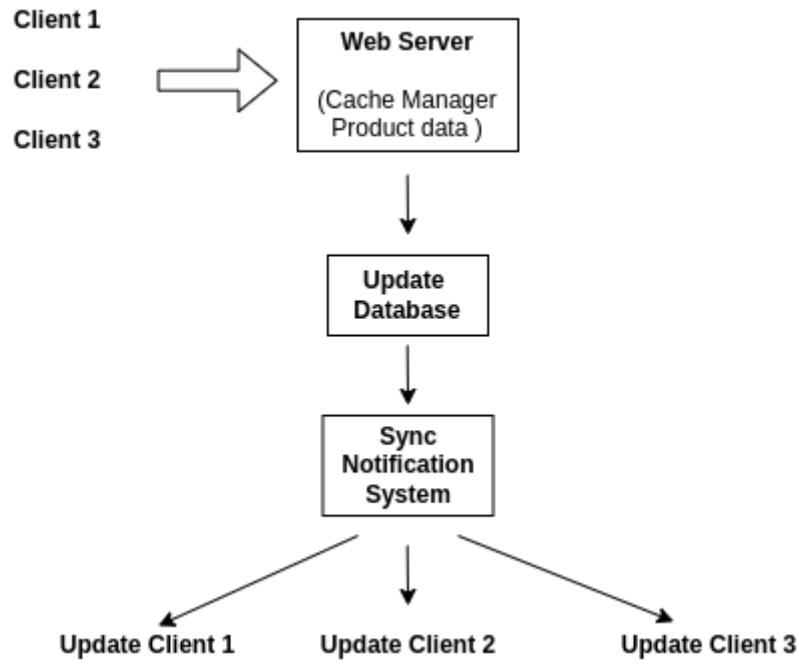

Figure 39 : Real-time data synchronization patterns

4.4 Asynchronous Test Client Development

Apache JMeter allows a full check of the system's concurrent performance by using automated clients that imitate how users interact with the system. Both GET and POST methods are tested using requests at all the main endpoints in the application.

In test configurations, multiple groups of threads replicate various simultaneous user activities with various start and request timing. All the tests under concurrent load conditions showed that the app could handle sign-in, registration, working with the shopping cart and order processing, all without any mistakes.

5. Clean Architecture Design

5.1 Multi-tier Architecture Preservation

The change shows that Clean Architecture can handle dependencies independently, no matter where they are used. Controllers rely on service interfaces, services use repositories in their abstractions and entities are free from external connections, so the system can be tested and used flexibly.

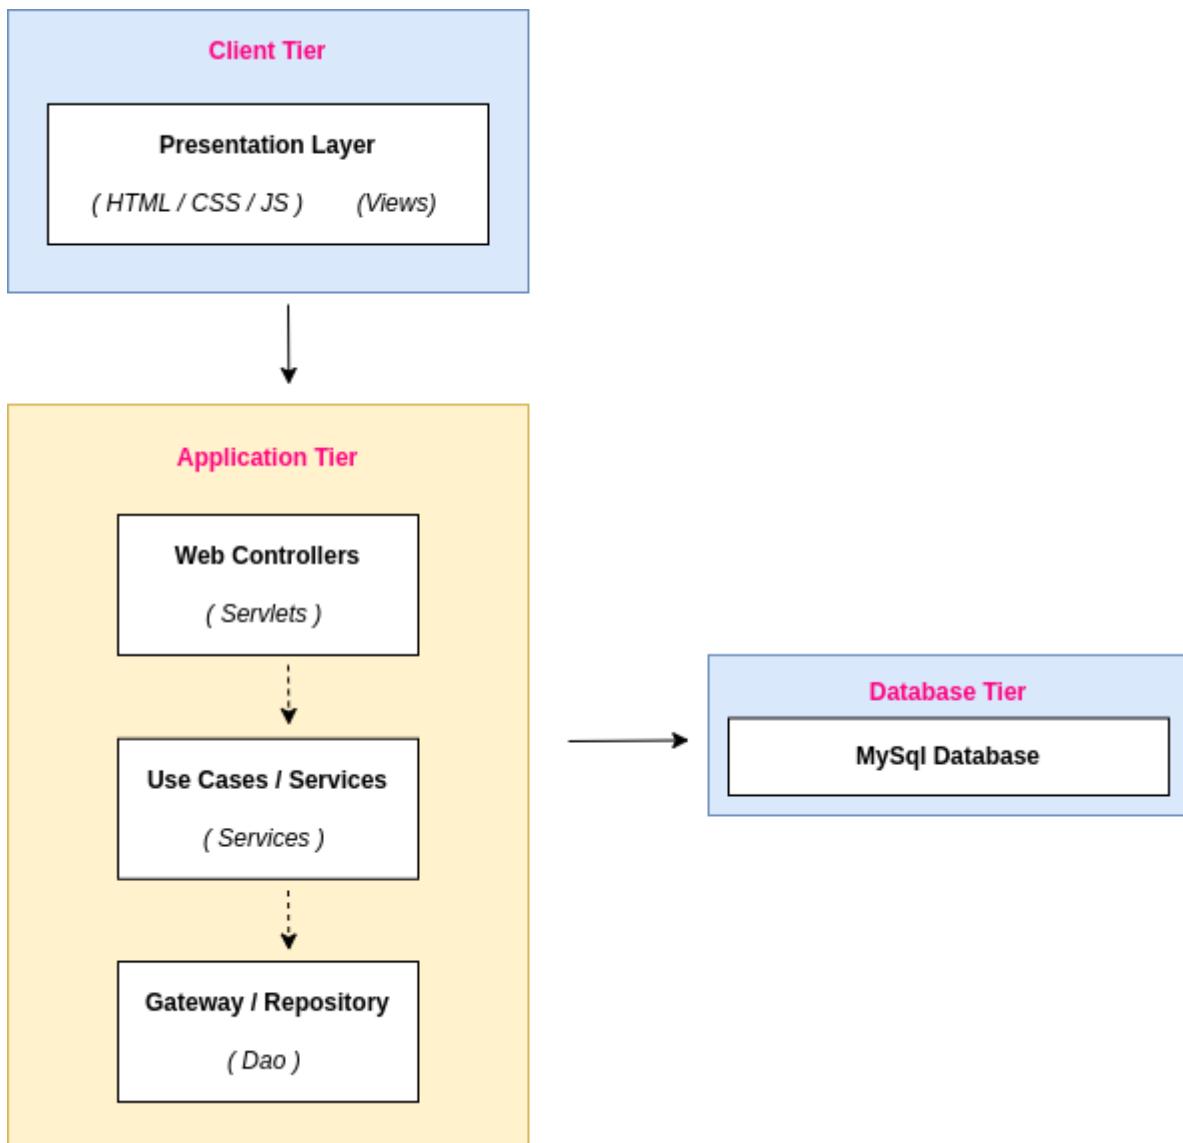

Figure 53 : Clean Architecture preservation across distributed tiers

5.2. Folder Structure

This section will discuss on the current folder structure of the project ensuring to logically separate the client and server separately.

Key Feature of folder architecture,

- Clear Separation Between Client and Server
 - WEB-INF - Contains all client-side web interface components
 - Src - Contains all server-side business logic
- Evolution from Assignment 1
 - Original controller package from CLI system is now unused
 - servlets package replaces controllers for web requests
 - All business logic preserved in service layer
- Clear Architecture Preservation
 - Presentation Layer - JSP files in WEB-INF/views/
 - Business Layer - Services in src/service/
 - Data Layer - DAOs in src/dao/
- Design Pattern Organization
 - Command - Command pattern implementations
 - Observer - Observer pattern for notifications
 - Strategy - Strategy pattern for reports
 - State - State pattern for user roles
 - Factory - Factory pattern for object creation
- Web Interface Structure
 - admin/ subfolder for administrative interfaces
 - assets/ for static resources (CSS, JS)
 - base-layout.jsp as master template

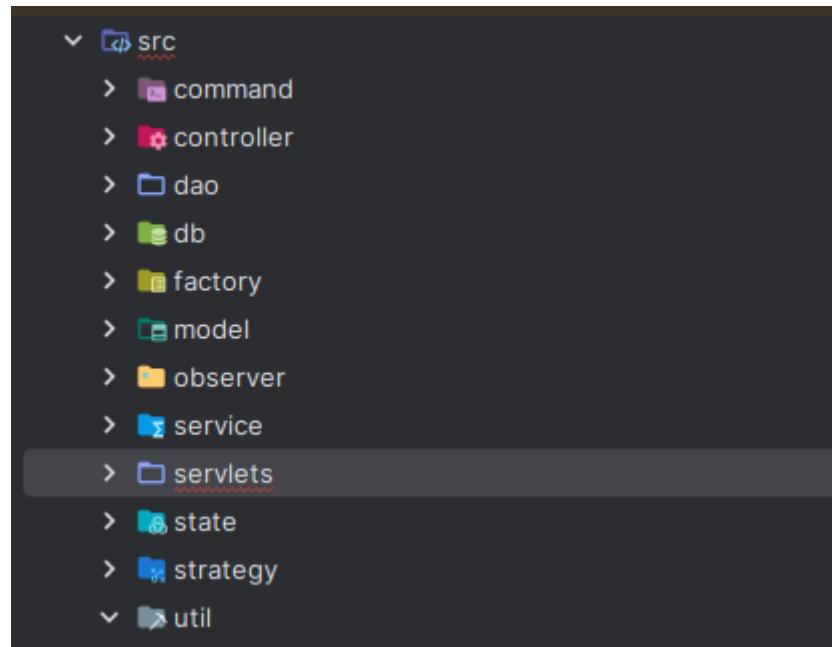

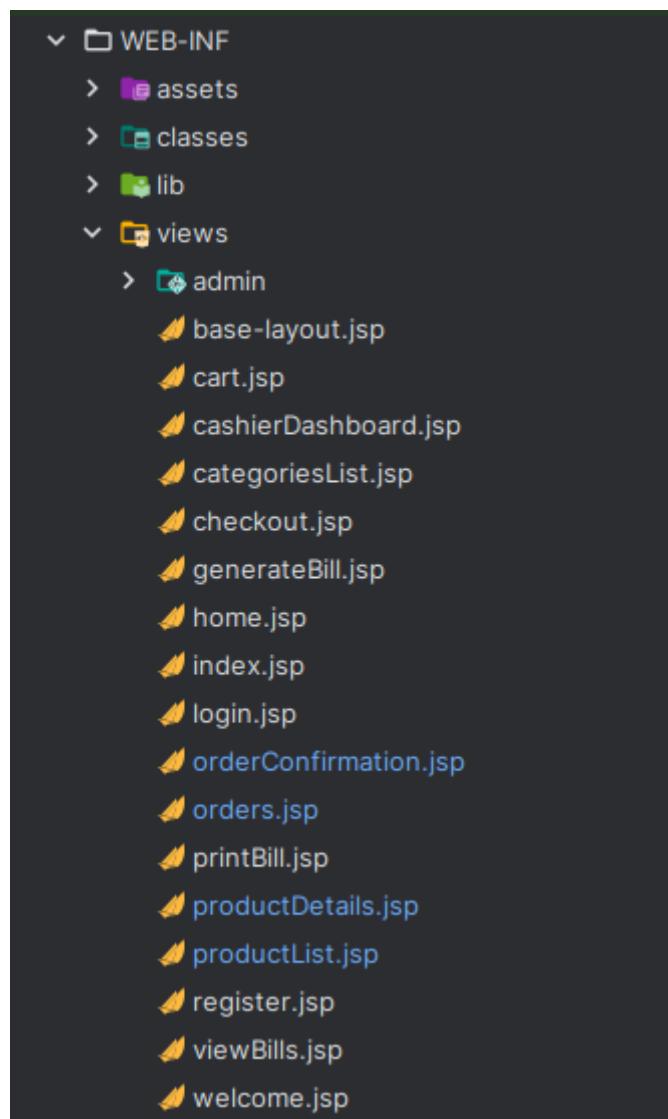

Figure 54 : Folder structure

5.3. Implementation Discussion

5.3.1. Online and Physical Stock Management

Orders for customers who buy online products are saved in the order table. And the inventory of those products is managed in the stock table. Bills for customers who buy physical products are saved in the bills table as before, and the inventory of those who buy physical products is managed in the shelves.

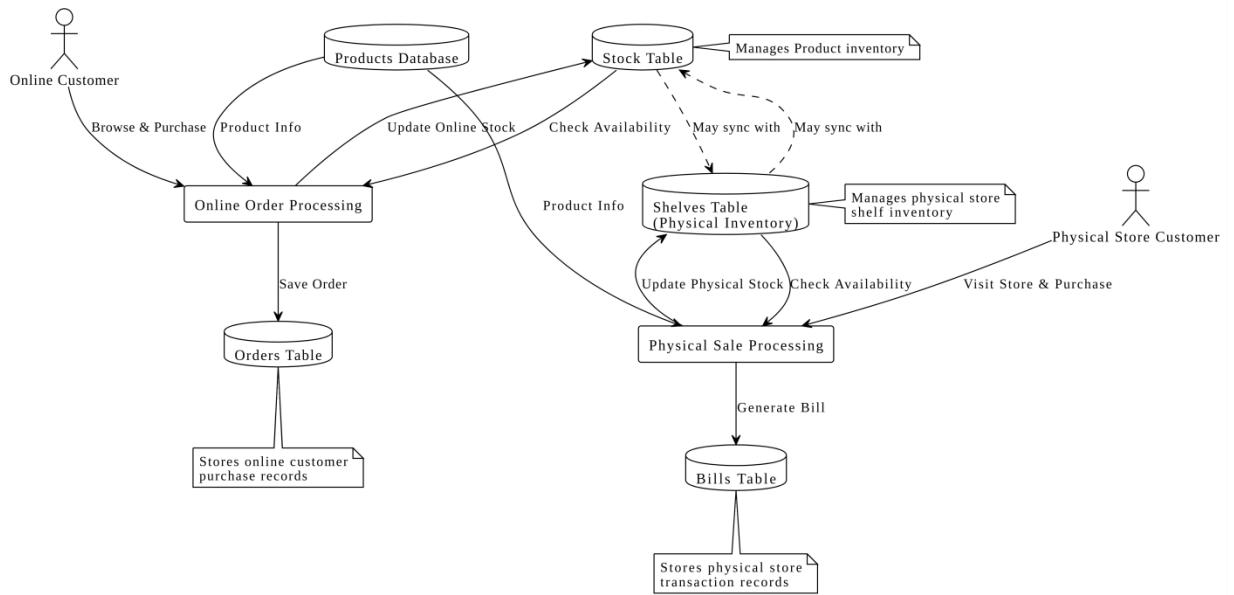

Figure 55 : Online and Physical Stock Management Diagram

5.3.2. Java Servlet Architecture Implementation Discussion

Java Servlets in the SYOS system carry out the MVC pattern by controlling the back-and-forth HTTP request-response process between the client and the server. Let's use LoginServlet as an example to understand why. Using `@.WebServlet`, LoginServlet was mapped to URL `/login` to ensure clean URL routing and help separate presentation, business logic and data access.

Sophisticated session control is shown by the LoginServlet with its dual methods. The `doGet()` method validates a session by verifying that a user is logged in with `if (session != null && session.getAttribute("username") != null)`. If a user is active and logged in, an automatic redirect is provided so they can easily get back to the home page.

Validation of credentials in the `doPost()` method follows Clean Architecture by using `userDao.validateCredentials(username, password)`. After successful authentication, the servlet

sets up a new session and keeps user information by setting session.setAttribute("username", username). Remember-me is a feature added through session.setMaxInactiveInterval(30 * 24 * 60 * 60) which allows users to decide how long their session stays active before expiring. When JSPs are put in the WEB-INF directory, they cannot be accessed directly with HTTP which ensures all navigation goes through the servlet application. Anyone who uses /login will be taken care of by LoginServlet which will authorize the request and then forward it to login.jsp protected in WEB-INF. This set-up makes it easy to process multiple requests and keeps the platform fully capable.

```
public class LoginServlet extends HttpServlet {

    @Override
    public void init() {
        userDao = new UserDao();
    }

    public void setUserDao(IUserDao userDao) {
        this.userDao = userDao;
    }

    @Override
    protected void doGet(HttpServletRequest request, HttpServletResponse response) throws ServletException, IOException {
        // If user is already logged in, redirect to home page
        HttpSession session = request.getSession(false);
        if (session != null && session.getAttribute("username") != null) {
            response.sendRedirect(location: request.getContextPath() + "/home");
            return;
        }

        request.getRequestDispatcher("/WEB-INF/views/login.jsp").forward(request, response);
    }

    @Override
    protected void doPost(HttpServletRequest request, HttpServletResponse response) throws ServletException, IOException {
        String username = request.getParameter("username");
        String password = request.getParameter("password");
        String rememberMe = request.getParameter("remember-me");

        try {
            if (userDao.validateCredentials(username, password)) {
                // Create session and set attributes
                HttpSession session = request.getSession();
                session.setAttribute("username", username);

                // If remember-me is checked, extend session timeout (30 days)
                if (rememberMe != null) {
                    session.setMaxInactiveInterval(30 * 24 * 60 * 60);
                }

                // Check if there is a stored return URL
                String returnUrl = (String) session.getAttribute("returnUrl");
            }
        }
    }
}
```

Figure 56 : Login Servlet Code

5.3.3. Java Server Pages

This system for Java Server Pages uses components to promote modularity and allow code to be used multiple times. To keep user access secure, the WEB-INF directory holds all the JSP files, so navigation requires using servlet controllers. Following this design supports Java EE security and continues to use the MVC pattern cleanly. Using the component-based pattern,

programmers build reusable UI features for recurring things like headers, footers and navigation menus. Instead of copying the same features throughout, the system adds these components to various areas using a module system. As a result of this, it becomes much more convenient to make changes to the common elements, because these are updated for every page that uses them. As an example, changing the navigation or branding needs to be done to just one header component instead of touching many pages. The home page illustrates this style by organizing shared features and including them randomly as needed. The page makes use of a main template that structures the page, displays a navigation and branding header, holds home content features and has a footer with information found on all pages. Because of this approach, the site maintains a similar design everywhere but allows every page to modify its content areas separately, making it easier to maintain the platform.

```
1 > <header class="bg-indigo-600 text-white shadow-md" ...>
2
3     <main class="container-custom flex-grow py-8">
4         <jsp:include page="${param.contentPage}" />
5     </main>
6
7 > <footer class="bg-gray-800 text-white py-8" ...>
8     </body>
9     </html>
```

Figure 57 : base layout jsp

```
<jsp:forward page="base-layout.jsp">
    <jsp:param name="contentPage" value="welcome.jsp"/>
</jsp:forward>
```

Figure 58 : welcome jsp

5.3.4. Testing

I used JUnit and Mockito to check if the servlet functions worked.

6. Critical Analysis and Discussion

6.1. Strengths in Clean Architecture Implementation

Passing from a console to a web application while remaining true to Clean Architecture is an excellent example of architectural discipline. Because controllers depend on services and services use repositories, the system is well suited for testing and maintenance. One advantage is that it neatly separates business logic from ways of displaying information which allows both parts to change independently.

this system lets you deploy services on numerous machines for greater scalability. If we strictly separate the presentation layer from the business and data areas, we will be able to change the architecture in the future without much difficulty.

6.2. Concurrency Architecture Analysis

Both the cleverness and the limits of server-side concurrency are well demonstrated in the implementation. Tomcat with a thread pool of 200 and an acceptCount of 100 and supported by Apache DBCP, is the right solution for companies with moderate-scale needs. However, sequential processing is very safe, but it can become very slow when there is a major increase in requests.

Critical Observation - Servlet-based concurrency limits the system's effectiveness in modern, high-traffic scenarios. I/O and event-driven approaches such as Spring WebFlux, have grown popular in today's systems to help use resources optimally.

6.3. User Experience and Interface Design

6.3.1. GUI Implementation Assessment

They made sure that all Admin, Cashier and Customer roles have complete dashboard implementations that optimize their roles and tasks. Because Tailwind CSS supports responsive design, the site will display well on all devices important in modern retail.

Strengths Identified,

- Complete CRUD operations across all entities
- Real-time form validation with feedback
- Contextual help systems and notification mechanisms

- Mobile-responsive design patterns

Areas for Enhancement,

- The image of the interface indicates a common design which although practical, lacks use of up-to-date patterns like progressive disclosure or micro-interactions
- While the billing interface is rich with features, it looks complicated and might be easier to use if it was redesigned into a simpler workflow structure

6.4. Technical Implementation Critique

6.4.1. Database and Performance Considerations

It's surprising that the connection pooling strategy set for an e-commerce platform is so low. Even though using launches this way saves resources, it can cause delays during the highest usage times. This wait time allows users to work well with your app, but it may hide performance problems.

Gaps - There is no discussion in the report about important database strategies such as indexing, query optimization or caching mechanisms. These issues must be handled carefully for platforms managing inventory changes at the same time.

6.4.2. Security and Data Integrity

The report discusses secure authentication and the use of prepared statements to stop SQL injections, but it does not do a thorough security analysis. Current e-commerce applications would need:

- HTTPS enforcement
- CSRF protection
- Input sanitization beyond SQL injection
- Session management security
- Password hashing and storage best practices

There is a critical gap in the analysis because information on security implementation is lacking.

6.5. Testing and Quality Assurance

JMeter Testing Analysis

Apache JMeter allows you to test multiple critical parts of your system for smooth performance. Since the test scenarios used GET and POST requests for many website paths, the system demonstrates good capability to handle many simultaneous tasks.

Testing Strengths,

- Protection for endpoints is completely comprehensive.
- Realistic simulation using more than one user at the same time
- Offering services for both authentication and transaction testing

7. Conclusion

The improved SYOS Point of Sale system proves that Clean Architecture principles work well in developing multi-tier distributed web applications. All the objectives of the assignment are met and a solid base for current e-commerce operations is established by the implementation. Using advanced web development techniques, the GUI is still simple for users to use. With careful thread management and well-optimized database connections, server-side concurrency mechanisms can deal with many clients using the server at one time. By following multi-tier architecture, Clean Architecture can be distributed and the scale of system components can be managed individually. A well-structured test case checks that the system can work with many visitors at the same time and keep all information accurate and reliable. The new system is a better version than the console app and will support growing demands for the business.
